User Story:

- As a security manager, I want to be able to remove accounts so that accounts that are no longer in use can be deleted, freeing storage space.

Detailed Work Tasks:

- Access Account information
  - Username
  - Last login
  - Email
- Remove accounts
- Alter account information
- Access general storage

Acceptance Scenarios:

- Given the account list, when the security manager wishes to view an account, then he/she will be presented with all the relevant information
- Given an account information, when the security manager wishes to delete the account, then he/she will be able to do so.
- Given that the task to delete an account is requested (from above), when the security manager confirms the deletion, then the account is permanently deleted.
- Give an account's information, when the security manager wants to alter information, then the security manager will select and change the information
- Given the security manager is viewing account information, when the information is shown, then the security manager will not be able to see passwords or other sensitive information.

Done Done:

- When the security manager can access all account(non-sensitive) information about the users
- The security manager can delete accounts when he/she deems worthy
- Easily navigate all the necessary information.
